SET Phishing Tool (Cybersecurity Practice Lab)

Networkwalks Academy

SET (Social Engineer Toolkit) Phishing Tool

(Cybersecurity & Ethical Hacking Labs)

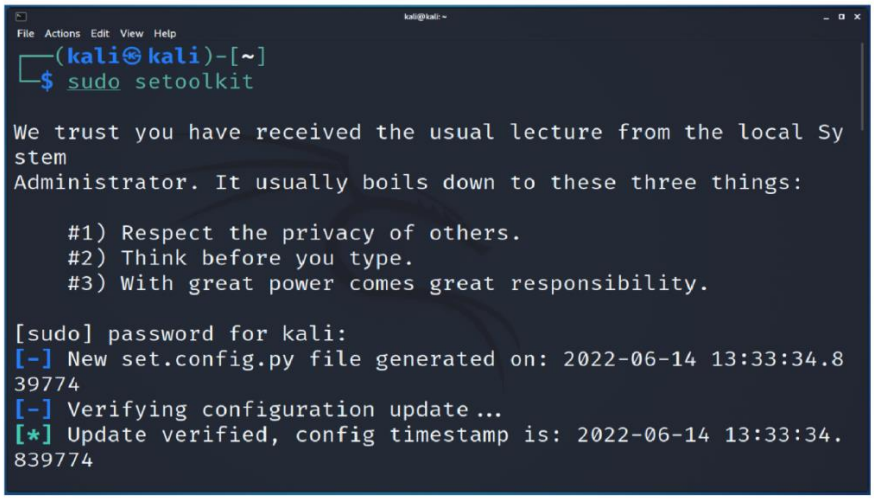
BACKGROUND: *The Social Engineer Toolkit (SET) is an open-source penetration testing framework designed for social engineering. SET has a number of custom attack vectors that allow you to make a believable attack in a fraction of time. These kind of tools use human behaviors to trick them to the attack vectors. In this practice lab, we will learn how hackers create phishing pages with SET. So that we can understand and prevent such attacks. We will use Kali Linux 2021.3 but you are free to use any laters version.*

Tasks

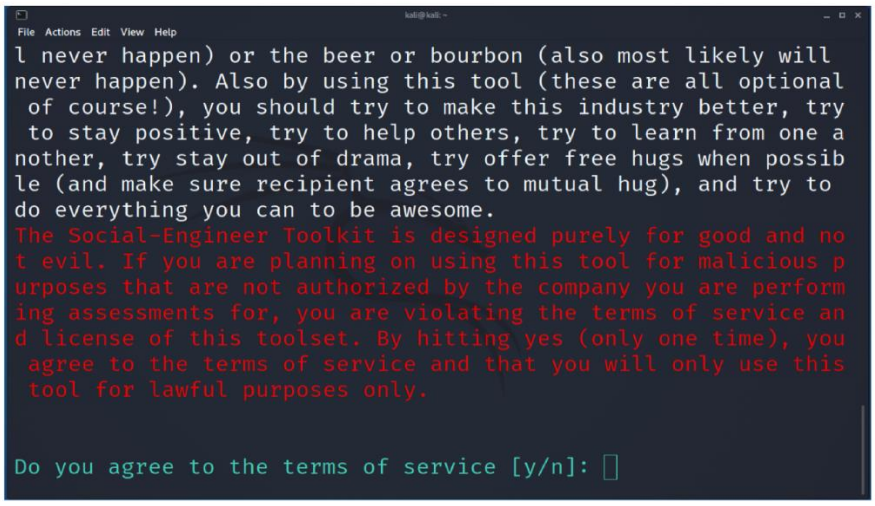
Create a phishing facebook page with SET (Social Engineer Toolkit).

Solution

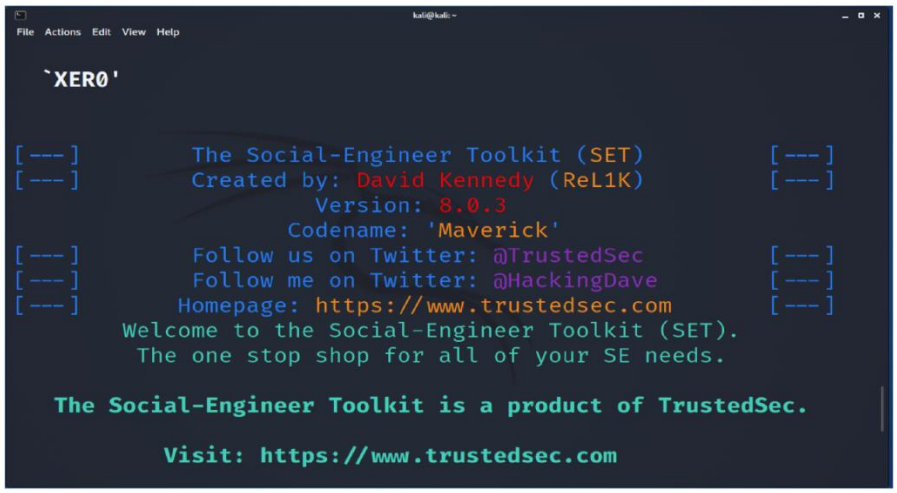
Step1 **Open up the Linux terminal and type "sudo setoolkit" to execute the command as a superuser and press enter.**



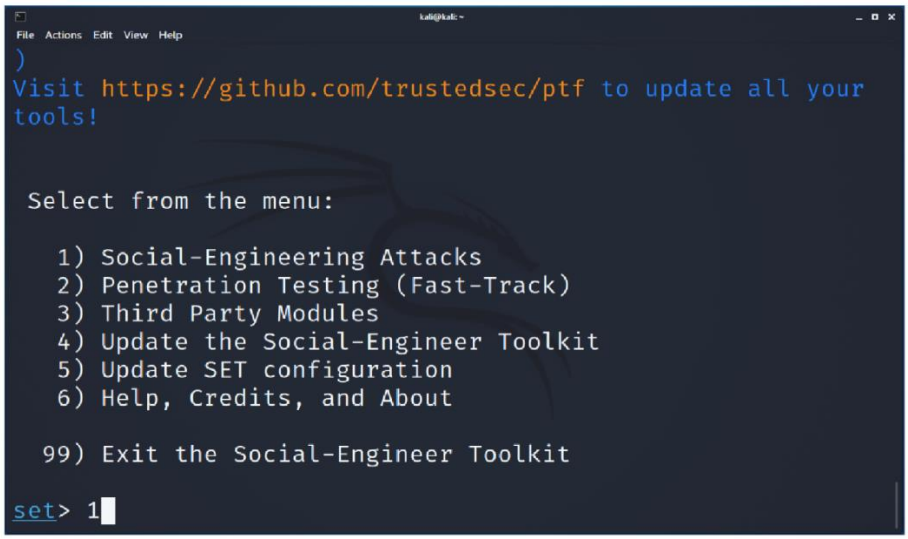
Step2 **Type "y" for yes to agree to the terms of service and press enter.**



Step3 **The SET interface would be launched with a welcome message.**

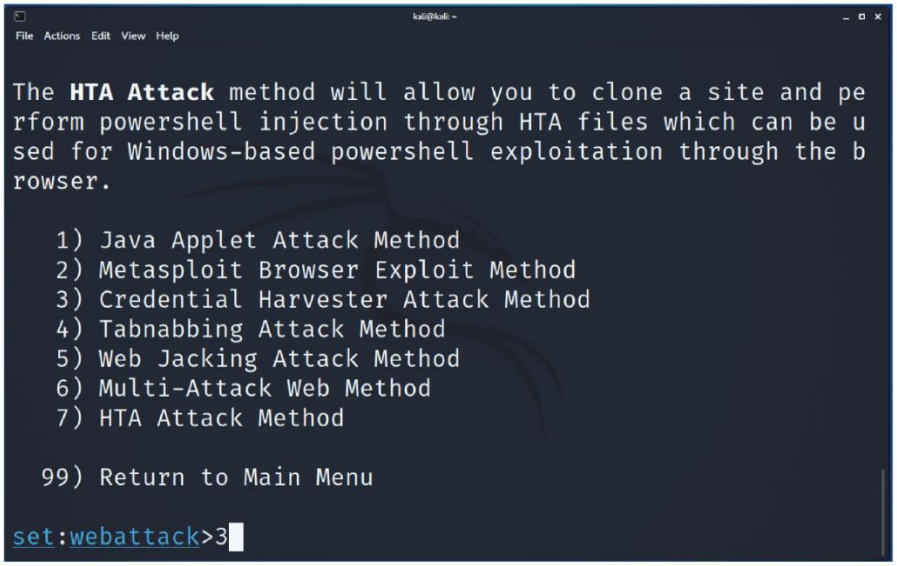


Step4 **Once SET is launched, it will display a few options, type 1 for "Social-Engineering Attacks" and hit enter.**



Step5 **Another menu appears, type 2 for "Website Attack Vectors" and press enter.**

Step6 **Type 3 for "Credential Harvester Attack Method", and press enter.**



Step7 **Type 2 for "Site Cloner" to clone a target website and hit enter. This is an advanced feature that clones most websites.**

```
 and allow you to utilize the attack vectors within the com
pletely
 same web application you were attempting to clone.

 The third method allows you to import your own website, no
te that you
 should only have an index.html when using the import websi
te
 functionality.

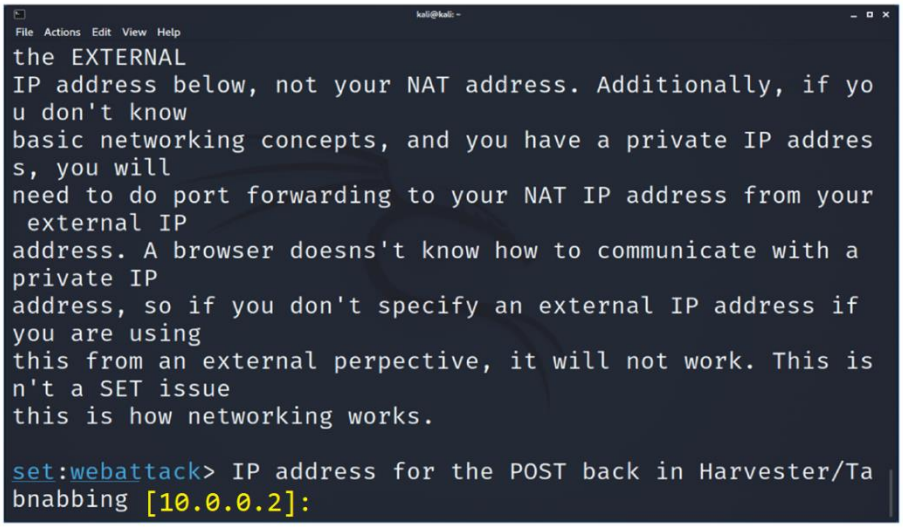
   1) Web Templates
   2) Site Cloner
   3) Custom Import

  99) Return to Webattack Menu

set:webattack>2
```

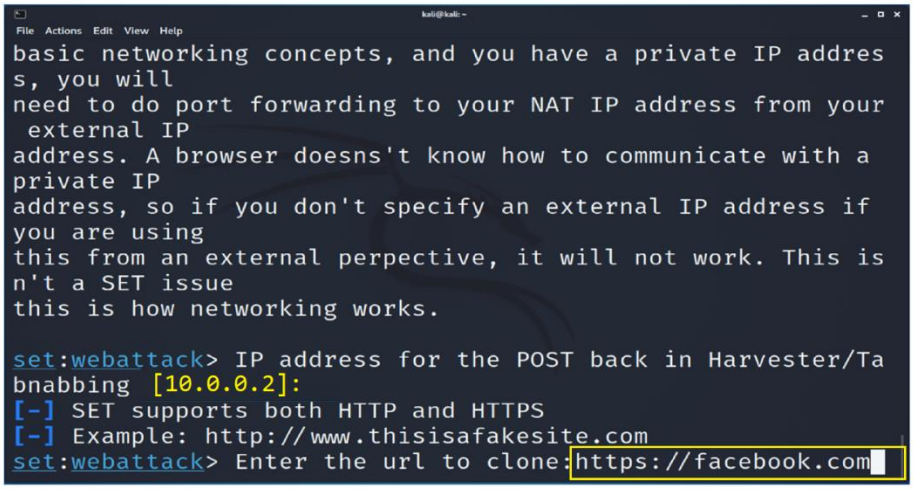
Step8 **Set an IP address to host the cloned site and hit enter (we will enter 10.0.0.2 as an example here).**

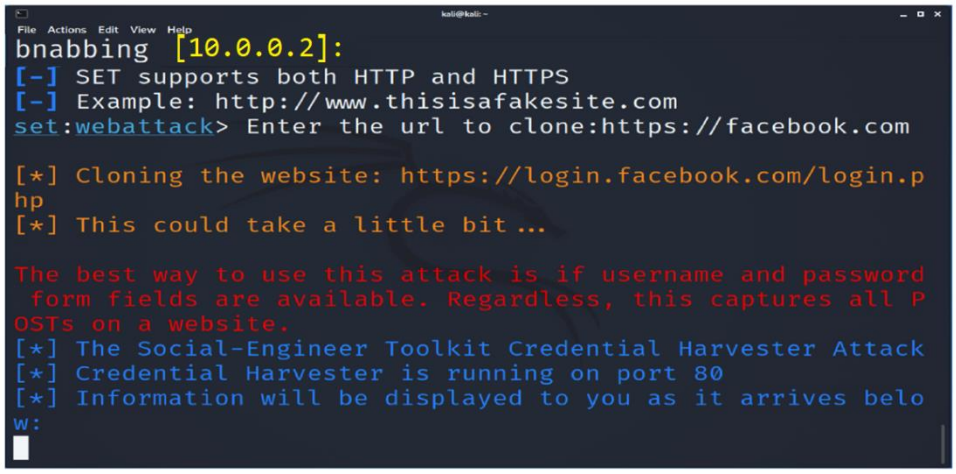
Note: *If you are testing on a virtual lab, then leave it blank & press enter (it will set local IP). If you are performing this in real-time scenario then use the publicly accessible static IP of your hacking server.*



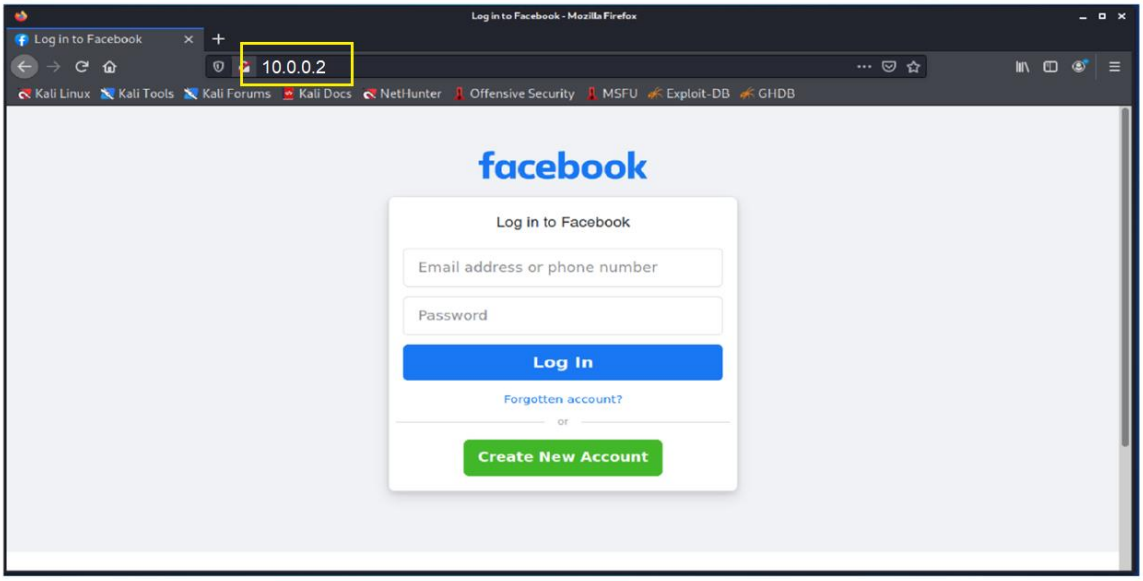
Step9 **Now, type in the URL of a site that you want to clone. For instance, https://facebook.com and press enter.**

***Note**: Ensure you type in the protocol like "https" in the URL.*

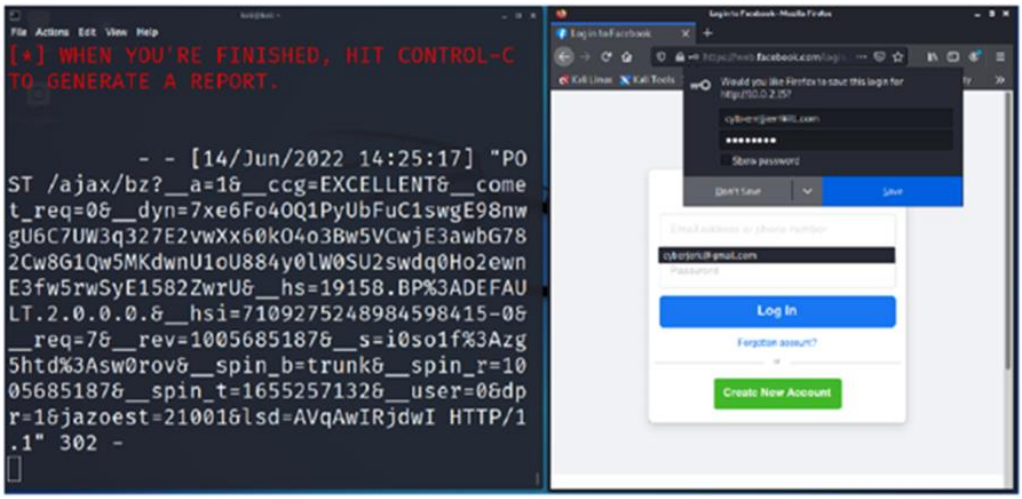




Step10 **Open up a browser, which will serve as a victim in this case, and enter the IP address of the URL site. E.g. 10.0.2.15.**



Step11 **Once the webpage loads up, type in a fake log-in email and password and click the log in button.**



Step12 **You should be able to see the email and the password in plaintext on the terminal.**

Any actions and or activities related to these study materials is solely your responsibility. The misuse of this information can result in criminal charges brought against the persons in question.

Warning: Hacking is a crime & we are not responsible for the way you use it !

- Hacking is only legal under the following circumstances:

1. You hack (penetration test) a device/network you own.
2. You gain explicit, documented permission from an individual, assumedly a friend.
3. You acquire an Ethical Hacker Certification and hack for a public or private sector organization with explicit permission to do so. This is the safest of the three methods.

- Hacking is illegal in all other circumstances. Hackers can be charged with fines, misdemeanors, and/or felonies depending on severity and accounts of hacks. For these reasons I will not be demonstrating any live hacking attempts in the wild.
